LAB2-3 Install and use clamAV

ClamAV is the open-source standard for mail gateway-scanning software plus includes a multi-threaded scanner daemon, command-line utilities for on-demand file scanning and automatic signature updates.

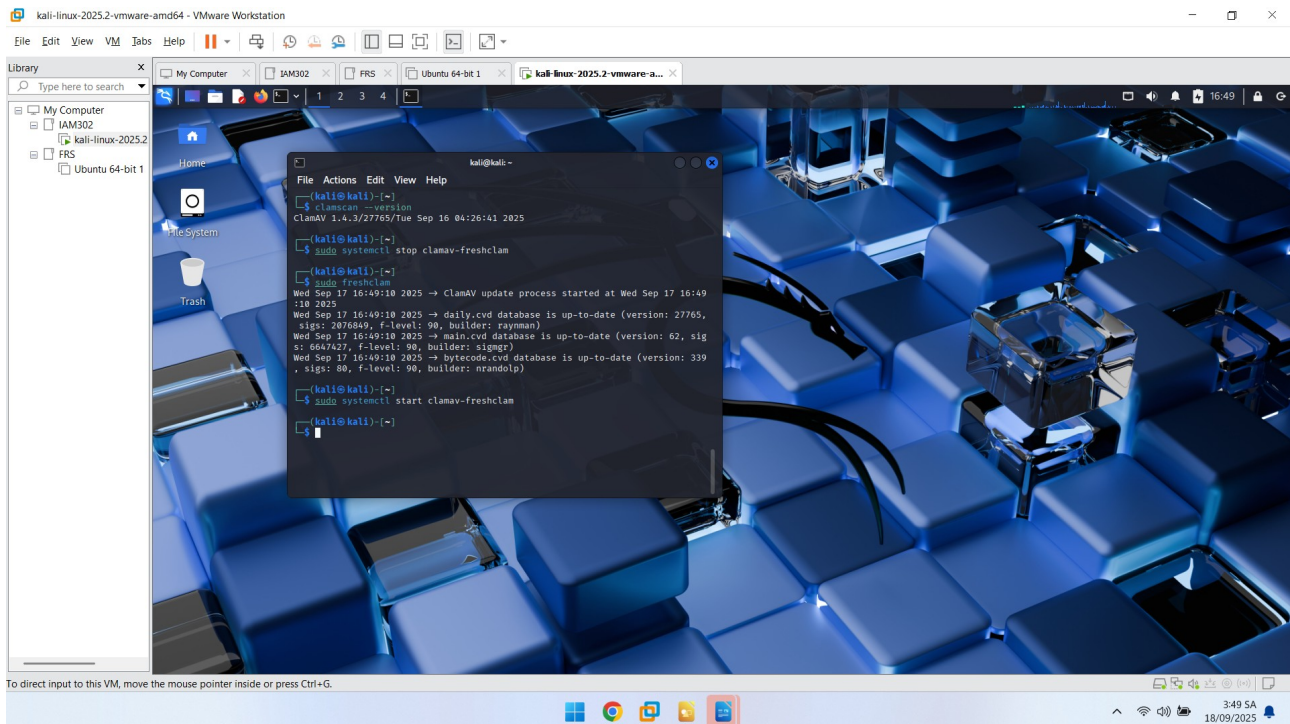

Procedure:

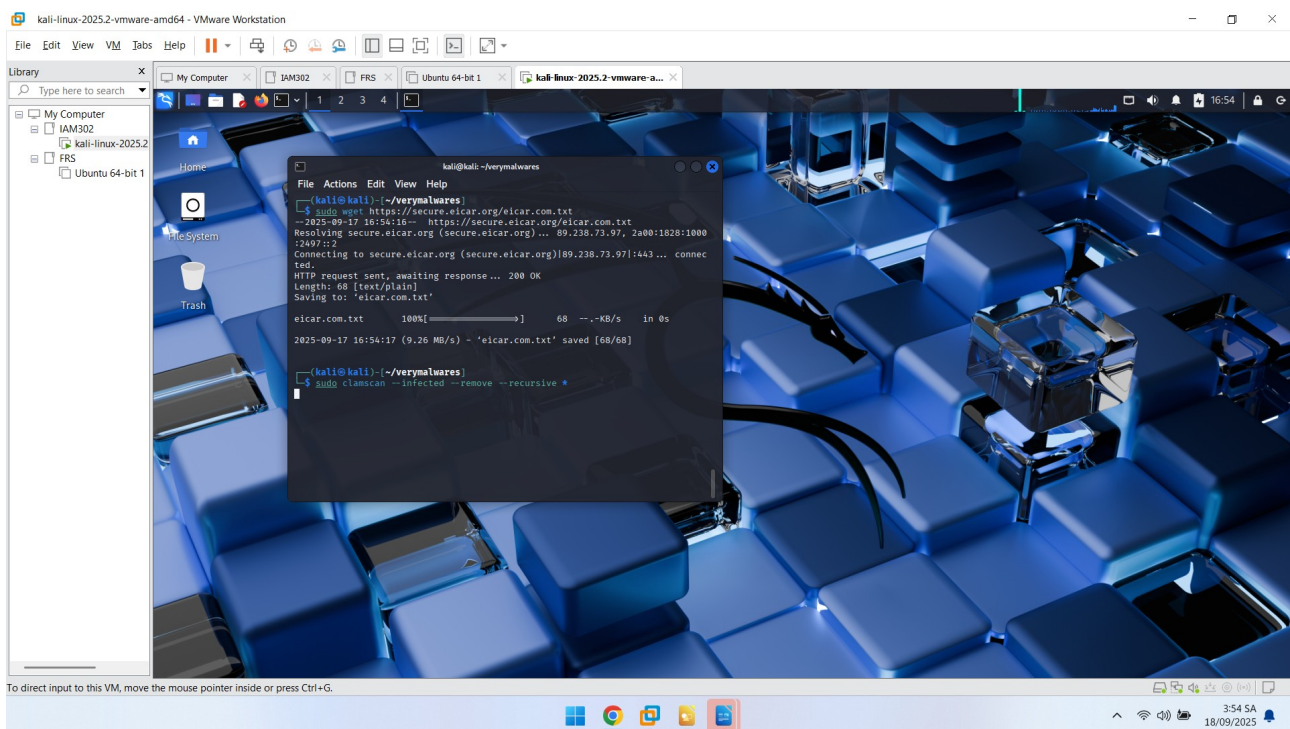

First thing to do is update the OS and install **ClamAV**.

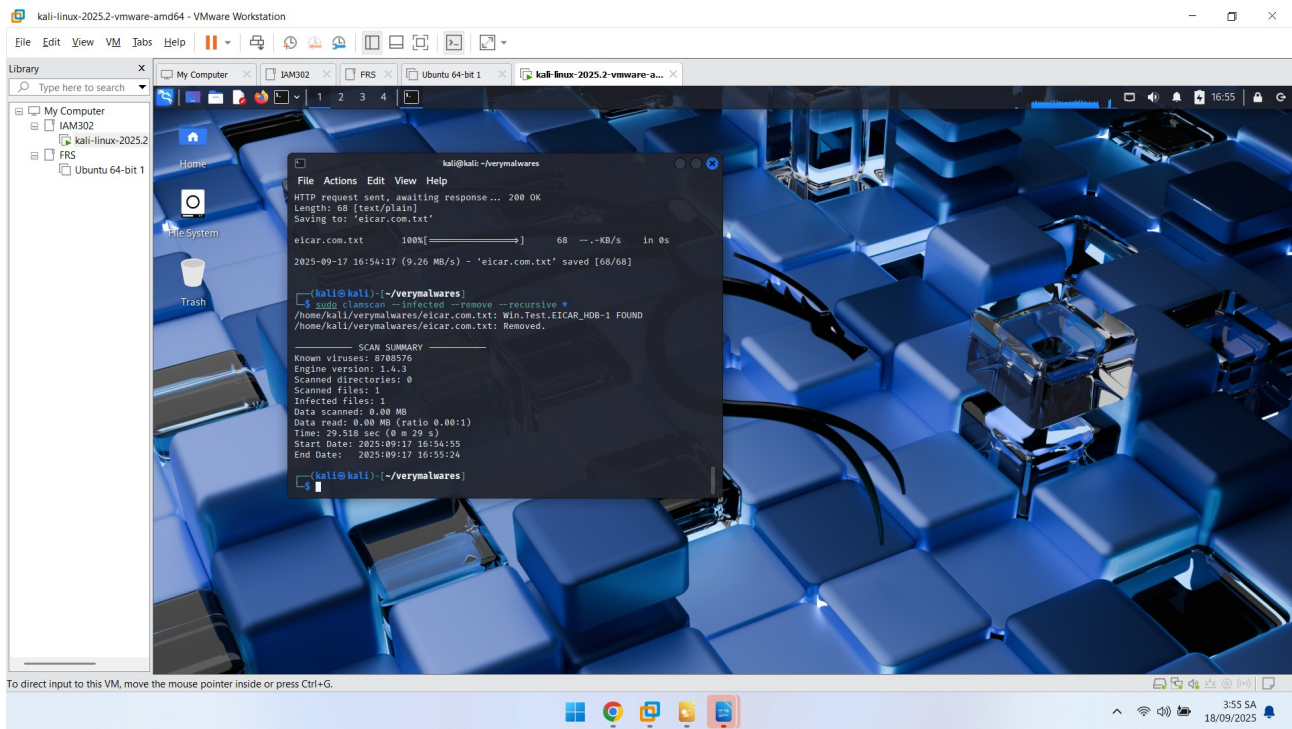

Checking if we installed it, yes it installed!

Due to the systemctl run service in clamav to up to date database we need to stop and refresh **freshclam**, next it to create dir and download the malware: **sudo wget**
<https://secure.eicar.org/eicar.com.txt>

After download it we will scan it in present dir that we download malware

The digital we signed to it next time AV check use signed digital to compare if it a virus or not which you see it is.
